

VCU Expands Product Portfolio

September 2010

Berkshire based VCU Europa Ltd is pleased to announce that it has entered into an agreement with US compost technology manufacturer Engineered Compost Systems (ECS) to deliver its range of composting solutions in the UK.

<http://www.compostsystems.com>

The cooperation is largely in response to the stringent new permitting requirements announced recently which will primarily affect open windrow sites situated within 250m of a receptor.

The products offered include a proprietary range of Aerated Static Piles 'ASP' systems for enhanced maturation and include covered piles; above and below ground, positive and negative aeration; and the patented 'Compdog' technology.

VCU Europa is well known for its ABPR-compliant vertical in-vessel composting technology which has been installed on over 30 sites worldwide. The company will use its position in the market, established over 15 years, to expand its offer to include solutions for green waste composters looking to upgrade their sites to comply with the new regulations.

ECS have been chosen as they have a significant installed base in the US using their proprietary 'CompTroller' process control and automation system that operates using temperature and oxygen monitoring. In the UK, VCU Europa will use local fabricators and manage all aspects of the projects to ensure it can offer a fast and affordable response to its customers.

“The cooperation sits well with our existing business” explains VCU Europa’s General Manager, Steve Morris. “Our own VCU™ technology, being fully enclosed already, meets the regulators requirements. However, we are seeing a significant increase in enquires from composters, especially green waste sites, concerned about the impact of the new regulations and looking at cost effective and practical ways to ensure their sites comply. The products from ECS complement our own technology and allow us to further expand our reach in the organic recycling sector”.
